

Date of report 13 May 2019

Reported case interaction between Dolutegravir and Mineral supplements

Drugs suspected to be involved in the DDI

Victim	Daily Dose
Dolutegravir	50 (mg)
Dose adjustment performed	Administration Route
No	Oral
Start date	End date
Dec. 2, 2015	Ongoing

Perpetrator	Daily Dose
Mineral supplements	Unknown
Dose adjustment performed No	Administration Route Oral
Start date	End date
Unknown	Ongoing

Complete list of drugs taken by the patient

Antiretroviral treatment Dolutegravir/Abacavir/Lamivudine

Complete list of all comedications taken by the patient, included that involved in the DDI

Zinc, cimicifuga, echinacea, licorice, giner, perilla, vitD3

Clinical case description

Gender	Age
Female	51
eGFR (mL/min) >60	Liver function impairment No

Description

Patient taking Triumeq plus different alternative medicines including zinc suplements. Potential interaction between zinc and Triumeq. It was recommended to take the supplements and the rest of complementary treatments separately 12h from Triumeq.

Clinical Outcome

No unwanted outcome

Editorial Comment

Coadministration may decrease dolutegravir concentrations due to complex binding to polyvalent ions (chelation). It is recommended to administer dolutegravir 2 hours before or 6 hours after taking the supplements containing polyvalent cations. Although the magnitude of the decrease in doluteravir concentrations may be ameliorated by taking dolutegravir and supplements together with food, there no data on zinc supplements specifically.

University of Liverpool Recommendation

Potential interaction - may require close monitoring, alteration of drug dosage or timing of administration
