

Date of report 23 Dec 2020

## Reported case interaction between **Tenofovir-AF** and **Gentamicin**

### Drugs suspected to be involved in the DDI

Perpetrator

**Tenofovir-AF**

Daily Dose

10 (mg)

Dose adjustment performed

No

Administration Route

Oral

Start date

Unknown

End date

Unknown

**Gentamicin**

Daily Dose

42 (mg)

Dose adjustment performed

No

Administration Route

Intravenous

Start date

Unknown

End date

Unknown

## Complete list of drugs taken by the patient

Antiretroviral treatment

Darunavir/Cobicistat/Emtricitabine/Tenofovir-AF

Complete list of all comedications taken by the patient, included that involved in the DDI

gentamicin, valaciclovir, pantoprazole, olanzapine, fluconazole, citalopram, oxycodone, paracetamol, dexamethasone, cytarabine, carboplatin, piperacillin, tazobactam

## Clinical case description

Gender

Male

Age

46

eGFR (mL/min)

>60

Liver function impairment

No

Description

Patient on stable TAF-based antiretroviral treatment who developed proximal tubulopathy when treated with gentamicin for febrile neutropenia in the context of relapsed Hodgkin lymphoma. Within 24 h after starting gentamicin, piperacillin and tazobactam, the patient developed marked hypokalaemia, hypophosphatemia requiring intravenous replacement therapy. The patient had proteinuria, glycosuria and evidence of marked urinary electrolyte wasting, consistent with acute proximal tubular dysfunction. Eleven days after stopping gentamicin, the serum biochemistry normalised. The urinary electrolyte wasting and proteinuria had improved and the glycosuria had resolved.

## Clinical Outcome

### Toxicity

## Drug Interaction Probability Scale (DIPS)

Score

**2 - Possible**

## Editorial Comment

Mitochondrial dysfunction has been associated with both aminoglycoside and tenofovir-associated nephrotoxicity so a synergistic mitochondrial toxicity could be a possible explanation for the occurrence of nephrotoxicity. In addition, sepsis and lymphopenia could potentially lead to the accumulation of tenofovir (derived from TAF) and gentamicin in the proximal tubular cells thereby causing mitochondrial toxicity and proximal tubular dysfunction. This case has been published by Heron JE et al. BMC Nephrology 2020.

## University of Liverpool Recommendation

◆ No clinically significant interaction expected
