Reported case interaction between Efavirenz and Melissa officinalis

Drugs suspected to be involved in the DDI

Efavirenz	Daily Dose 600 (mg)
Dose adjustment performed	Administration Route
No	Oral
Start date	End date
Unknown	Ongoing
	Daily Daga
Melissa officinalis	Daily Dose 600 (mg)
Dose adjustment performed	Administration Route
No	Oral
Start date	End date
Unknown	Unknown

Complete list of drugs taken by the patient

Antiretroviral treatment Efavirenz Abacavir/Lamivudine

Complete list of all comedications taken by the patient, included that involved in the DDI

Melissa officinalis

Clinical case description

Gender	Age
Female	55
eGFR (mL/min) >60	Liver function impairment No

Description

This is a case of female patient, 55 years old, Caucasian, with no liver and kidney impairment, high 165 cm, weight 88 kg, BMI=32.3 kg/m² (obese). HIV-1 infection was diagnosed in 2010 and soon after cART was initiated as follows: efavirenz (600 mg QD) + fixed-dose combination of two NRTIs: abacavir (ABC, 600 mg) and lamivudine (3TC,300 mg), achieving undetectable HIV-1 RNA and CD4+ T-cells count above 600 cells/mm³. In 2019, she was diagnosed with metabolic syndrome. Together with cART patient selfprescribed herbal supplement - lemon balm (Melissa officinalis), known as a herbal supplement for the treatment of insulin-resistance and dyslipidemia. She was taking lemon balm tablets 300 mg BID standardized to 7% Rosmarinic acid and 14% Hydroxycinnamic acids. According to the literature review, there were not much data about DDIs in humans on cART and lemon balm. Thus, we performed TDM using validated high-performance liquid chromatography (HPLC) assay and it has shown efavirenz plasma concentration of $C_{trough} = 1907.349$ ng/mL. Pharmacokinetic variability of the nonnucleoside reverse transcriptase inhibitor efavirenz has been documented in the literature and a plasma therapeutic range of 1000–4000 ng/mL has been established for the efavirenz. Thus, we concluded that there is no clinically relevant drug-drug interaction between lemon balm and efavirenz. Furthermore, in the same patient HIV RNA pVL was undetectable.

Clinical Outcome

No unwanted outcome

Editorial Comment

Despite the lack of information on how Melissa officinalis may interact with antiretroviral drugs, this clinical case suggests no relevant impact of Melissa officinalis on Efavirenz plasma concentrations.
