

Date of report 28 Dec 2022

## Reported case interaction between **Cobicistat** and **Mirtazapine**

### Drugs suspected to be involved in the DDI

Perpetrator

**Cobicistat**

Daily Dose

150 (mg)

Dose adjustment performed

No

Administration Route

Oral

Start date

Nov. 13, 2015

End date

Sept. 8, 2022

Victim

**Mirtazapine**

Daily Dose

15 (mg)

Dose adjustment performed

No

Administration Route

Oral

Start date

May 19, 2022

End date

Ongoing

## Complete list of drugs taken by the patient

Antiretroviral treatment

Darunavir/Cobicistat/Emtricitabine/Tenofovir-AF

Complete list of all comedications taken by the patient, included that involved in the DDI

Mirtazapine 15 mg/24h Clonazepam 0.5 mg /8h, vortioxetine 20 mg/24h topiramate 75 mg/24h lormetazepam 2 mg/24h

## Clinical case description

Gender

Male

Age

44

eGFR (mL/min)

>60

Liver function impairment

No

Description

44 years old man. HIV diagnosed in 2006. History of Kaposi sarcoma (remision) and Multicentric Castlemann disease (remision).

His history of ART regimens is:

- TDF/FTC + NEV from April 2010 to June 2013
  - ABC/3TC + NEV from June 2013 to September 2013
  - ABC/3TC + DRV/rito from September 2013 to November 2015
  - ABC/3TC + DRV/cobi from November 2015 to march 2019
  - Since March 2019 he is taking ART with TAF/FTC/DRV/cobi
- At this moment HIV well controlled with HIV RNA <40 copies/mL and CD4 count 1239 (39%).

He also receives treatment for depression and anxiety since 2005. Mirtazapine was initiated in 2012. He has also received diazepam or alprazolam during some periods. Because of impairment of symptoms his Psychiatrist prescribed

vortioxetine 20 mg/24h and topiramate 75 mg/24h in March and Clonazepam 0.5 mg /8h and lormetazepam 2 mg/24h in May 2022.

As mirtazapine is metabolised by CYP2D6, CYP1A2 and CYP3A4, darunavir/cobicistat could potentially increase mirtazapine concentration. He never had symptoms suggesting mirtazapine related toxicity, probably because of the low dose of mirtazapine.

On the other hand, vortioxetine is mainly metabolized by CYP2D6 and to a lesser extent by CYP2C9 and CYP3A4/5. Since darunavir/cobicistat is a weak inhibitor of CYP2D6 no a priori dosage adjustment is needed. However clinical monitoring is necessary and dose reduction of vortioxetine could be needed.

ART was switched to TAF/FTC+doravirine in september 2022 to avoid potential ddi if psychiatric drugs or doses must be changed.

## Clinical Outcome

**No unwanted outcome**

## Editorial Comment

In case of a suspected drug-drug interaction (DDI), one can assess the impact of the DDI by either measure plasma drug levels or the efficacy/toxicity of the affected drug. Here, we do not have information on drug levels, but apparently there was no difference observed in toxicity of mirtazapine. So, if there was an increase in mirtazapine levels due to CYP3A inhibition by cobicistat, this did not lead to toxic levels.

## University of Liverpool Recommendation

- Potential interaction - may require close monitoring, alteration of drug dosage or timing of administration
